Focus

Stereo enhancement & low frequency control

Take control of your stereo panorama

Rapid, intuitive access to the big sound professionals strive for. Take complete control of your stereo panorama with three powerful tools offering incredible flexibility in a highly accessible and configurable combination.

Three award winning plug-ins

With these award-winning plug-ins you can naturally widen or reduce the stereo image, focus and define low frequencies, and move specific captured spectra within the stereo soundfield. All three plug-ins are highly mono-compatible, using unique algorithms that maintain the original character of the source audio without introducing strange phase, reverb or delay related artefacts.

Stereoizer

Powerful stereo enhancement

Add natural sounding width and depth to any mono or stereo recording, leaving the character of the source intact. Achieve a more coherent sound with polish and spatial balance without adding artificial reverb, chorusing or delay. Total mono compatibility with no unwanted artefacts.

Monofilter

Essential bass management

Now you can sharpen, define, align and anchor your bass for the tightest mix. Quickly anchor the power, and retain the essential character and perceived spatial characteristics of the original sound. Align and balance low frequencies with minimum effort, for a louder and better defined mix.

Stereoplacer

21st century pan control

Stereoplacer is a plug-in with precise stereo-positioning control that takes you beyond the traditional mix setup. Focus in on the frequencies you want to move using the solo controls and then tweak, fix or align them in the stereo panorama without affecting any other regions - all with total mono compatibility.

Key features

- Work confidently with full mono-compatibility
- Anchor low frequency power and sharpen bass
- Expand stereo naturally and artifact-free
- Leave original source character intact
